

ABSTRACT OF THE DISCLOSURE

A computer-aided transaction processing method and system for documenting transactions conducted in a network environment. The system includes a first database for storing a user identifier and identity information for at least two users. An information processing system manages a transaction between the at least two users, wherein a transaction identifier is associated with the transaction. A second database stores a database record. The database record contains the transaction identifier, user identifiers of the at least two users involved in the transaction, and corresponding transactional data.
